Immerse™ uses clinically effective low air loss therapy to prevent and treat pressure injuries, particularly in patients who have already undergone surgical repair. Immersion provides proper envelopment to effectively manage pressure redistribution. Low air loss manages the microclimate, while pulsation adds gentle stimulation to increase capillary blood flow to the tissue.

— Head-to-heel therapy: Prevention and treatment of PI's, full-thickness burns, flaps, and grafts
— Comfortable alternative to air-fluidized therapy
— Clinically effective low air loss: 1,740 liters of air per minute
— Automatic pressure adjustment for optimal comfort
— Fowler feature increases airflow when head section is elevated
Key Specs

MATTRESS
Capacity ...................... 600/1,000 lbs.
Width .......................... 35”, 39”, 42”, or 48”
Length .......................... 80”
Weight ........................... 37 lbs.
Sizes ................. Non-Bariatric and Bariatric Available

CONTROL UNIT
Liters of Air Per Minute .......................... 1740
Pulsating Low Air Loss .......... 3, 5, or 10 Min.
Alarms ......................... Power Failure and Low Pressure
Pressure Sensor Technology ........ Yes
CPR Release ...................... Yes
Unit Weight ..................... 16 lbs.

FABRIC OPTIONS
Nylon 70 Denier–Polyurethane-coated  . Standard
Polycarbonate 4-Way Stretch ............. Optional
Non-Skid Polyurethane Bottom Cover ..... Standard

1 — Envelops patient to effectively manage pressure redistribution

2 — Cooler than air-fluidized therapy—and at 37 lbs., able to be placed on multiple bed frames

3 — Head-to-heel therapy for PI prevention and treatment
(Pressure mapping features male patient, 5’8”, 220 lbs.)
