Percussion/Vibration Therapy
Rotation Therapy Add-On

Chest physiotherapy (CPT) aids patient breathing and facilitates oxygen and carbon dioxide exchange in the lungs. To aid this process, percussion/vibration therapy breaks up thick secretions in the lungs by repeatedly stimulating the chest wall. Our percussion/vibration therapy mode can be programmed to focus on one, two, or all three zones of the back, targeting fluid movement in patient lungs.

— Programmable therapy time can be set for 5, 10, or 20 minutes
— Three therapy options: percussion, vibration, or both
— Available on Big Turn™ or Rotate™ (35", 39" or 48" widths)
