Traditional Repositioning

- This is not a one-person task. DO NOT PULL FROM HEAD OF BED.
- When pulling a patient up in bed, the bed should be flat or in Trendelenburg position (when tolerated) to aid in gravity, with the side rail down.
- For patients with Stage 3 or 4 pressure ulcers, care should be taken to avoid shearing force.
- The height of the bed should be appropriate for staff safety (at the elbows).
- If the patient can assist when repositioning "up in bed," ask the patient to flex the knees and push on the count of three.
- During any lifting task, if the caregiver is required to lift more than 35 lbs. of a patient’s weight, then additional caregivers must be used.
